

CFD simulations of active wavemakers

A.E. Maguire, D. Ingram

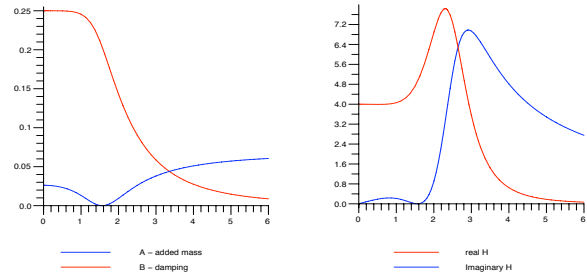

Work stream 1: Physical and numerical convergence

Introduction

This project is concerned with modeling active wave makers using CFD code. The control of these numerical paddles is based on the active absorption methods implemented by the wave paddles in Edinburgh's curved wave tank. These paddles use a hydrodynamic force feedback mechanism, pioneered by Stephen Salter [1] to dynamically control the paddle velocity to absorb incident waves.

CFX representation of a wave tank

Added Mass and Damping and resulting governing transfer function

The problem

Experimental wave tanks are used to test scale models before building expensive prototypes for the real sea. Numerical wave tanks are used for the very same reason, but give the designer more detailed feedback information and are proving to be an invaluable design tool. The problem is that both of these tools are adversely affected by wave reflections that send spurious waves into that test region.

FIG. 1. (a) Wave Generation and (b) Active Wave Absorption

The solution

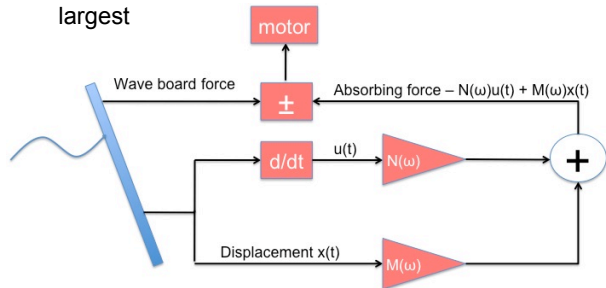

Optimal absorption is achieved if the paddle is moved in such a way that the boundary appears transparent to impinging waves. This can be achieved if a radiated wave of equal amplitude and opposite phase cause destructive interference with in reflected wave. Resulting in perfect absorption at a given distance from the paddle.

Methodology

"To destroy a wave means to create a wave"

The method used is analogous to that of impedance matching used in signal processing. Falnes [2] states two conditions required for maximal absorption:

- Oscillation velocity must be in phase with excitation force
- Absorption is at its maximum when destructive interference between incident and radiated wave is largest

Project aims

- Produce an adequate simulation of a wave maker in CFD
- Replicate a physically realisable method of active absorption using hydrodynamic force feedback
- Combine both of these techniques to obtain a CFD model of the active wavemakers used at Edinburgh and many other wave test centers
